Introduction

The Media Feed is made up of XML-based files that are progressively generated on election night. The results data extracted from NSWEC's Election Management Application (EMA) system database to a specified location at specified intervals.

The Media Feed is provided for both State and Local Government General Election events.

For State General Election (SGE) events, both Legislative Assembly and Legislative Council progressive result extracts are provided.

For Local Government Election (LGE) events, both Mayor and Councillor Contest progressive result extracts are provided.

The purpose of this document is to provide media agencies the following information:

- How to download the files, and what files are made available
- The detailed structure and contents of the files.

How and when to download files

When is the media feed available

The live media feed is usually available from approximately 7pm on election night and is updated continuously throughout the night. Zero files are generally made available before election night for reference purposes (see below).

How frequently is the media feed updated

The media feed extract files are produced at 5-minute intervals for an election event. During each 5 minute interval, if results in the EMA database have changed, new extract files will be generated and placed on the FTP site for download. However, if no change of in results data is recorded in a 5 minute interval, then no extract file would be produced.

From where can the media feed be downloaded

The media feed extract files are made available from NSWEC's access-restricted FTP site at <ftpsecure.elections.nsw.gov.au>. Separate step-by-step instructions are available for arranging access and connecting to this site.

Description of file series and filenames

Zero files

Zero files are generally published by NSWEC for LA, LC and LG events before election day. These files do not contain results data, but only the reference data for the election event (Contests, Venues, Candidates and Groups). These are only produced by NSWEC after that reference data becomes available within the EMA database. They have the same format as the corresponding LA, LC or LG results files, only the zero files do not contain vote count result. The zero files are identified as follows:

- LA Zero file, e.g., in SGE 2019 elections has the filename "00001-SG1901-LA.xml.zip"
- LC Zero file, e.g., in SGE 2019 elections has the filename "00001-SG1901-LC.xml.zip"
- LG Zero files, these are the first XML file generated for each of the LG areas. In LGE 2021, the zero files for some of the areas are:
 - 00001-Albury.xml
 - 00002-Armidale.xml
 - 00003-Ballina.xml

SGE results files

For SGEs, the following two file series are published, each file in the series containing election results at a particular point in time:

- Legislative Assembly (LA) result extract files
- Legislative Council (LC) result extract files

Legislative Assembly (LA) Media Feed File Extracts

LA Results Extract files are placed in a sub-folder named 'LA' on the FTP server. LA results for all State districts at a point in time are stored in a single XML file. The latest result extract file is also placed in a subfolder named 'Current' within the LA folder.

The 'Current' folder only ever contains the most recent result extract file, superseded files are removed from this folder but they remain available from the parent 'LA' folder.

The file name is structured as follows:

<extractsequencenumber>-<electioneventcode>-LA.xml.zip

Where

<extractsequencenumber> commencing from 000001

<electioneventcode> is the general election event code,

e.g., SG1901 for the March 2019 State General Election, example LA extract filenames:

000001-SG1901-LA.xml.zip

000002-SG1901-LA.xml.zip

Legislative Council (LC) Media Feed File Extracts

LC Results Extract files are placed in a sub-folder named 'LC' on the FTP server. All LC results at a point in time are stored in a single XML file. The latest result extract file is also placed inside a subfolder named 'Current' within the LC folder.

The 'Current' folder only ever contains the most recent result extract file, superseded files are removed from this folder but they remain available from the parent 'LC' folder.

The file name is structured as follows:

<extractsequencenumber>-<electioneventcode>-LC.xml.zip

Where

<extractsequencenumber> commencing from 000001

<electioneventcode> is the general election event code,

e.g., SG1901 for the March 2019 State General Election, example LC extract filenames:

000001-SG1901-LC.xml.zip

000002-SG1901-LC.xml.zip

LGE results files

For LGEs, the one file series contains both the Mayor and Councillor Contests results for all council areas, with each file in the series containing results for only one council area, and at a particular point in time.

LG Results Extract files are placed in a folder named after the LG election event ID (e.g., LG1701) on the FTP server. Results for each council area are stored in separate XML files. LG by-election result extracts (for the areas covered by the by-election) are identical to LG General Election result extracts. The most recent results file for each area is also placed inside a subfolder named 'Current' inside the LG election event folder.

The 'Current' folder only ever contains the most recent result extract files for each council area, superseded files are removed from this folder, but they remain available from the parent LG election event folder.

The file name is structured as follows:

<extractsequencenumber>-<councilareacode>.xml

Where

<extractsequencenumber> commencing from 000001

<councilareacode> is the council area code

Example LG extract filenames:

000001-Burwood.xml

000002-Ashfield.xml

By-election results files

By-election results files follow the same format as for the relevant type of general election.

Schema files

State LC Results XSD File

State_LC_Results_202
1_V2.xsd

State LA Results XSD File

State_LA_Results_202
1_V2.xsd

Local Government Results XSD File

SGE XML Schema Definition

The Media Feed Extracts for SGE use 2 separate schema files, one for Legislative Assembly (LA) and another for Legislative Council (LC) XML file extracts. (Refer to sections 1.3.1 Legislative Assembly (LA) Media Feed File Extracts and 1.3.2 Legislative Council (LC) Media Feed File Extracts for the file names.)

Notes:

1. This document does not provide rules for validating the data types within an XML element.
2. Election Identifier “Id” attribute values:
 - LC = Legislative Council
 - LA = Legislative Assembly
3. Election Category values
 - Legislative Council (Senate element)
 - Legislative Assembly (House element)
4. Group Name element will not be populated for groups that are not endorsed by registered political parties
5. The LC group votes reported in these extracts are only for the First Preference above the line (ATL) votes. The votes for a Group without Group Voting Square are included in the Other votes.
6. Votes received by Ungrouped candidates is not reported, however, this are reported under the Other Votes.
7. The Legislative Council will have Informal votes included with the other votes and blank votes are also reported with other votes.
8. The number of votes to meet Quota will not be provided.
9. The results media feed data will not report TicketVotes since Tickets are not used in NSW
10. The election system will provide data from manual counts only during the Initial Count election phases. The check count data are provided from the VTR only using html reports.
 - ElectionNight = reports votes counted on Election Night
 - CountContinuing = reports votes counted after Election Night
 - InitialCountComplete = reports that all LA and LC First Preference votes have been counted and LA TCP, prior to check count.
11. Two candidates Preferred are provided for Polling Places on election night and for declaration vote types for close districts on the discretion of the NSW EC post-election night.
12. Vote Types and Venues.

Every Venue name is held in the Polling Place element. Each Polling Place element is given a Type which is an Attribute of the Polling Place element. The Types are;

- PP – Polling Place Ordinary votes
- PR – Pre-poll Ordinary votes
- DV – Declaration Vote

The Polling Place element is the Venue name for all PP Types.

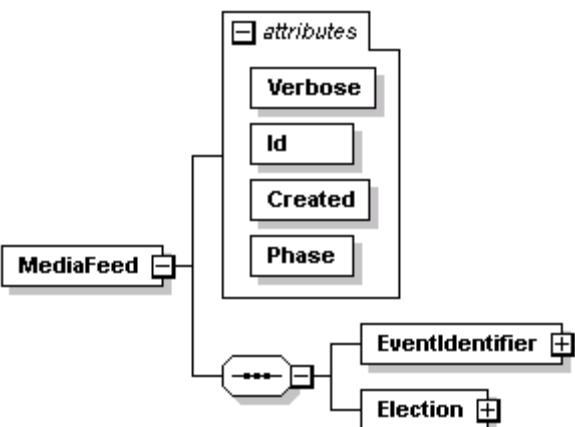

PR Types will use the venue name for each pre-poll where ordinary votes are taken. However, one venue in each district are called Declared Institution. This venue will hold all the ordinary votes for all the declared institutions in the district.

DV Types will use only the following Polling Place names in each district.

- Absent – votes taken outside the enrolled district
- Enrolment – votes taken for electors not enrolled in the district they are voting
- iVote – voted using the iVote system (if applicable)
- Postal – voted using a postal vote
- Enrolment/Provisional – either an Enrolment or Name Already Marked as Voted (NAMAV).

LGE XML Schema Definition

Area

Element electoralarea

This is a container for the results in one LGA. An electoral Area may be divided or undivided.

For the Local Government Election 2021, there are 128 electoral areas plus the Unincorporated Area. Some areas are not clients of the NSWEC, these are listed on the NSWEC website.

Where an LGA is not a client of NSWEC, VTR will display no results, but will display a message. The message can be tailored for each LGA (or the Unincorporated Area) and is to appear in element <text>.

The attribute @status-description may also be used. This defines the text that will appear in VTR when the user rolls the mouse over the text “Status:”.

diagram	<pre> classDiagram class electoralarea { id name timestamp timeslot election-name divided status status-text } electoralarea "0..1" --> text electoralarea "0..1" --> area_info electoralarea "0..1" --> mayoral_election electoralarea "0..infinity" --> referendum electoralarea "0..infinity" --> poll electoralarea "0..1" --> council_election electoralarea "0..infinity" --> electoralward </pre>

election-type	required	Allowed values OP – Optional Preferential. (Will always be OP for Mayoral election). (PR – Does not apply for Mayoral Election)								

	timestamp	required	Date and time that this data was updated.
	recount	required	A non-zero value indicates a recount has commenced
	status-text	optional	Can be used to define LGA and contest specific text for the given value of @status. This defines the text that will appear in VTR when the user rolls the mouse over the text "Status:". However, see also child element <text>
source	<pre> <xs:element name="mayoral_election"> <xs:complexType> <xs:sequence> <xs:element ref="statuses"/> <xs:element ref="text" minOccurs="0"/> <xs:element ref="candidates" minOccurs="0"/> <xs:element ref="polling_places" minOccurs="0"/> <xs:element ref="pre_poll" minOccurs="0"/> <xs:element ref="election_votes" minOccurs="0"/> </xs:sequence> <xs:attribute name="status" use="required"> <xs:simpleType> <xs:restriction base="xs:NMTOKEN"> <xs:enumeration value="CC-Dec-Complete"/> <xs:enumeration value="Uncontested"/> <xs:enumeration value="CC-Enabled"/> <xs:enumeration value="No-Status"/> <xs:enumeration value="Deferred"/> <xs:enumeration value="Final-for-Saturday"/> <xs:enumeration value="FC-Enabled"/> <xs:enumeration value="Uncontested-Declare-Election"/> <xs:enumeration value="Publish-Results"/> <xs:enumeration value="Declare-Election"/> </xs:restriction> <xs:simpleType> </xs:attribute> <xs:attribute name="election-type"> <xs:simpleType> <xs:restriction base="xs:NMTOKEN"> <xs:enumeration value="OP"/> </xs:restriction> <xs:simpleType> </xs:attribute> <xs:attribute name="timestamp" type="xs:dateTime" use="required"/> <xs:attribute name="status-text" type="xs:anySimpleType"/> <xs:attribute name="recount" type="xs:integer"/> </xs:complexType> </xs:element> </pre>		

Element council_election

The top level element for a council election. Optional attribute @election-type will always be “PR” as of 2012, and may be omitted from the XML.

Attribute @uses will always take the value “prcc” in 2012 and may be omitted from the XML.

Element //polling-places are specified unless the election is deferred or uncontested.

Attribute @vote-squares indicates whether or not the ballot paper contains group voting squares. Group voting squares may be above the line (ATL) or below the line (BTL).

Where there are a large number of candidates, it is possible that results for some candidates may not be reported on election night. Votes for “Unreported Candidates” are bundled in “Other Ballots”, which will also include informal votes. This could apply equally for ballot papers with both ATL and BTL squares.

Child element <text> can be used to display a specific message relating to this contest. For example, if the contest is uncontested.

diagram	<pre> classDiagram class council_election { id status election-type vote-squares uses vacancies timestamp status-text recount statuses +> text groups +> candidates +> polling_places +> pre_poll +> election_votes +> } </pre>

Candidates**Element candidates**

This is a wrapper element for one or more candidates.

diagram	
---------	---

children	candidate
used by	mayoral_election council_election
attributes	
source	<pre><xss:element name="candidates"> <xss:complexType> <xss:sequence> <xss:element ref="candidate" maxOccurs="unbounded"/> </xss:sequence> </xss:complexType> </xss:element></pre>

Element candidate

A candidate. The attribute @ballot_name is a unique identifier for each candidate within an electoral contest. The attribute @href is used elsewhere in the XML to identify each candidate. In each case where @href is used, its value must match a value of @ballot_name, which must be unique.

Where two candidates in one area share the same surname, it is essential that @ballot_name is unique within that area.

Where a candidate has a “double candidature” by being a candidate in both a Mayoral election and a Council election, then in each instance they have a different and unique ID.

In addition to the alphabetical characters “A” … “Z”, a candidate’s Ballot Name may also contain the following characters: “ ” (space), “-” (hyphen), “’” (apostrophe). No other characters are allowed.

diagram	<pre> classDiagram class candidate { id ballot_name elected { elected-mayor elected-count elected-position elected-date election_night_count } surname givennames drawnumber partyaffiliation } </pre>

	id	required	Candidate's unique ID.
	Ballot_name	required	Candidate's unique official ballot name
	elected	optional	This candidate has been elected in a given count. If value is equal "1", then the candidate has been elected. If candidate has not been elected, then this attribute is unspecified and defaults to "0".
	elected-mayor	optional	This candidate (in a Council election) has been elected mayor in the mayoral election and is excluded. If value is equal "1", then the candidate has been elected mayor. If candidate has not been elected mayor, then this attribute is unspecified and defaults to "0".
	elected-position	optional	This candidate has been elected in position "1", "2", "3", etc. @elected-position is only specified for Council elections, and only if @elected has been specified.
	elected-count	optional	The count in which the candidate was elected. @elected-count is only specified for Council elections, and only if @elected has been specified.
	elected-date	optional	Gives the date elected if the candidate has @elected="1". Format is: DD:MM:YYYY. Local date.
	election_night_count	required	Indicates whether or not votes are to be counted for this candidate on election night. Values: "1" (default) – count on election night. "0" – do not count on election night. This attribute will be used primarily by processes that generate the blank Results Reports sheets used by RO's on election night and on Sunday.

Element dec_votes

Declaration votes.

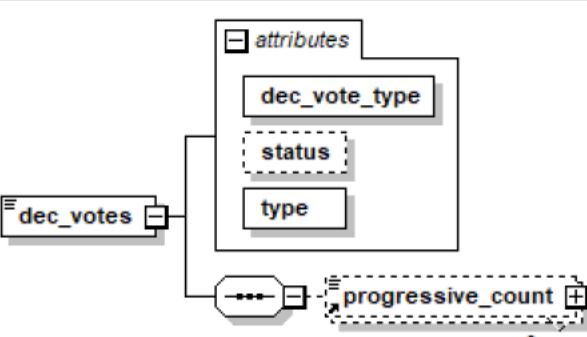

Where the parent element of //dec_votes is //cand_dec_votes, only the @type value "fp" is allowed.

Where the parent element of //dec_votes is //area_dec_votes, only the @type value "informal" is used.

@type value "exhausted" is not used for the 2012 election and onwards.

The value of @dec_vote_type is of type string and may vary from one election to another. Possible values are:

- Postal
- diprepoll (Declared Inst + Prepoll)
- prosilent (Provisional + Silent, if Silent is used in an event)
- ivote
- di_decvotes
